

I have built a clone of a movie streaming platform known as NETFLIX(Netflix-Clone). In my project the technology stack that is used are HTML, CSS, JAVASCRIPT, NODEJS ,REACTJS, and FIREBASE as a backend service.

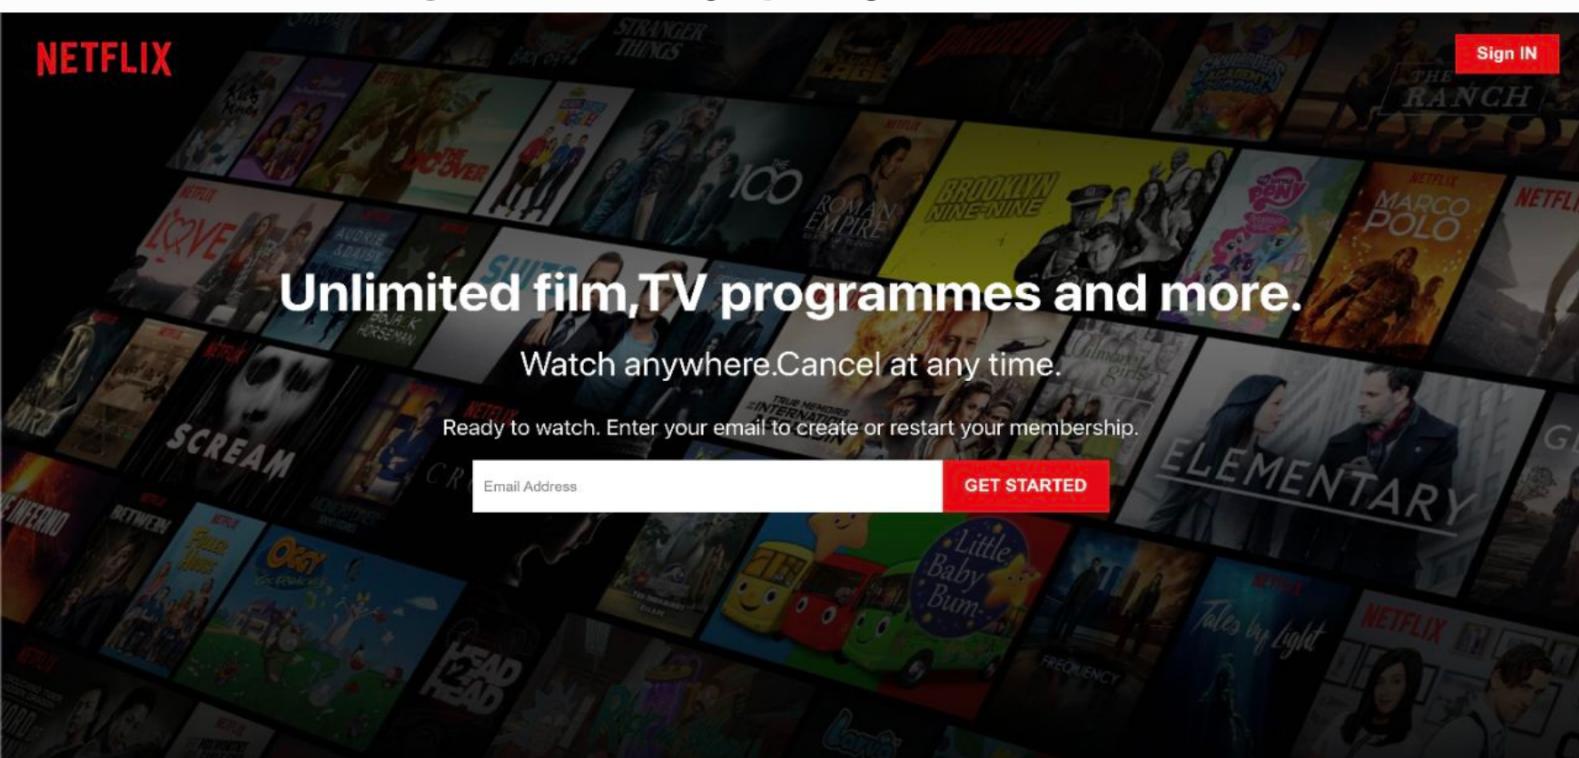

NETFLIX-CLONE is a full stack project having functionalities such as Login/ Signup function, Stripe payment gateway integration, TMDB API for featuring movies and their info, and at last, FIREBASE for backend and Database handling.

The link to my project is- <https://netflix-build-f1215.web.app/>

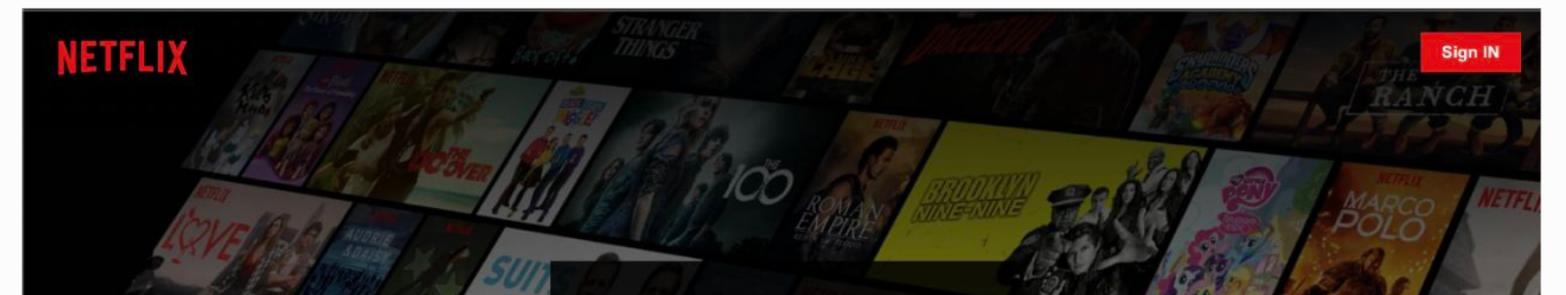

Apart from the technologies used in my project such as HTML, CSS , JAVASCRIPT, NODEJS, REACTSJS, FIREBASE, I am also familiar with EXPRESSJS, BOOTSTRAP ,C+

+ etc.

Some images of my project are below.

The screenshot shows a movie page for "The Snitch Cartel: Origins". The title is displayed prominently at the top left. Below the title are two buttons: "Play" and "My List". A brief plot summary follows: "In Cali during the '60s and '70s, two brothers juggle family, romance and the joint pursuit of a burning ambition: to rule Colombia's drug industry." The main image on the page is a still from the movie showing several characters in a room, with one man in the foreground wearing a red patterned shirt. At the bottom of the page, there is a section titled "NETFLIX ORIGINALS" featuring thumbnails for various other Netflix series like Money Heist, Squid Game, and Sex Education.
